

Experimental and Theoretical Study between CN radical and Acetonitrile CH₃CN Relevant to Astrochemical Environments

C. Sleiman, G. El Dib, S. González, D. Talbi, A. Canosa

Outline

- Astrophysical and Astrobiological interests

- Experimental Techniques

- Results and Discussions

Astrophysical and Prebiotic interests: Nitrogen species in interstellar medium (ISM)

- Nitrogen: 5th element in interstellar medium

≈ 50 detected species ($T = 7 - 20 \text{ K}$; $N = 10^4 - 10^6 \text{ cm}^{-3}$)

NH	CN	N_2	NH_2	HCN	HNC	N_2H^+
NH_3	HCNH+	NO	H_2CN	HCCN	C_3N	CH_2CN
CH_2NH	HC_3N	N_2O	HC_2NC	NH_2CN	C_3NH	CH_3CN
CH_3NC	HC_3NH^+	CH_2CNH	C_5N	CH_3NH_2	$\text{C}_3\text{H}_7\text{CN}$	HC_5N
$\text{CH}_3\text{C}_3\text{N}$	$\text{C}_2\text{H}_5\text{CN}$	CH_3CONH_2	HC_7N	$\text{CH}_3\text{C}_5\text{N}$	HC_9N	HC_{11}N
HC_2N	HC_3N	HC_4N	H_2CN	$\text{C}_2\text{H}_7\text{CN}$	CH_3CHNH	HCCNC
HCNO	CNCHO	NH_2CHO	CN^-	CH_3CONH_2	$\text{NH}_2\text{CH}_2\text{CN}$	HO CN

CN: Reactive radical, 2nd molecule detected in ISM after CH

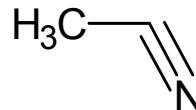

Typical Abundance with respect to $\text{H}_2 = 5 \times 10^{-9}$

Detected in comets (1940), ISM(1941), Solar system (1982)

Nitrogen species: Amino acids (DNA, RNA) → Prebiotic chemistry → Precursor

Astrophysical and Prebiotic interests: Studied reaction in this work

Acetonitrile

+ CN → Products

Acetonitrile:

one study at $T > 300\text{K}$
(Zabarnick et al. 1989)

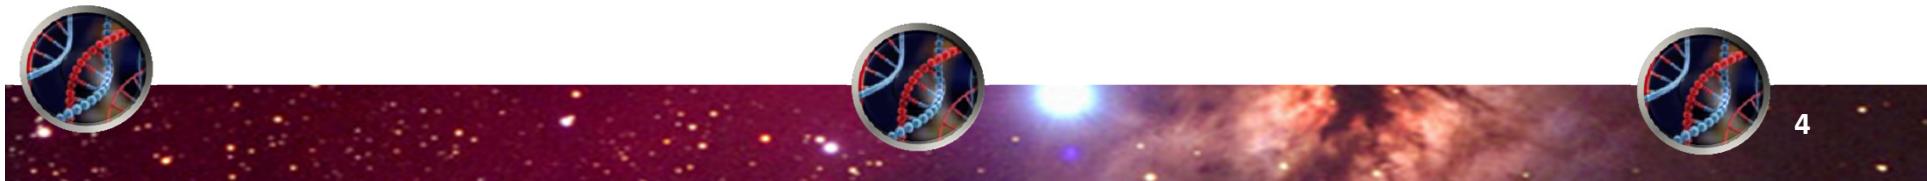

Temperature

23 K – 354 K

Only two studies of CN
with nitrogen species at
low temperatures

Motivation of this work:

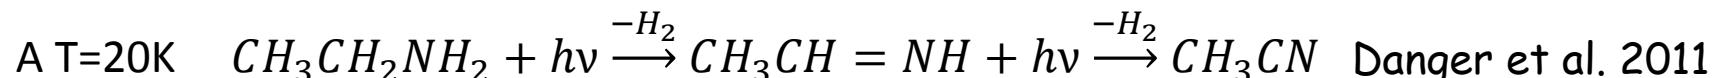

- Limited available data
- Interstellar chemistry of these species
- Prebiotic role
- Effect of temperature on the reactivity

Astrophysical and Prebiotic interests: Acetonitrile CH_3CN

CH_3CN Detected in gas phase in ISM (Solomon et al. 1971)

Formation in ISM:

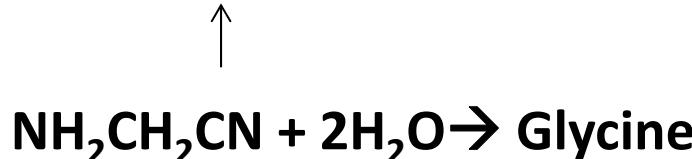

Potential precursor of amino acids (DNA, RNA)

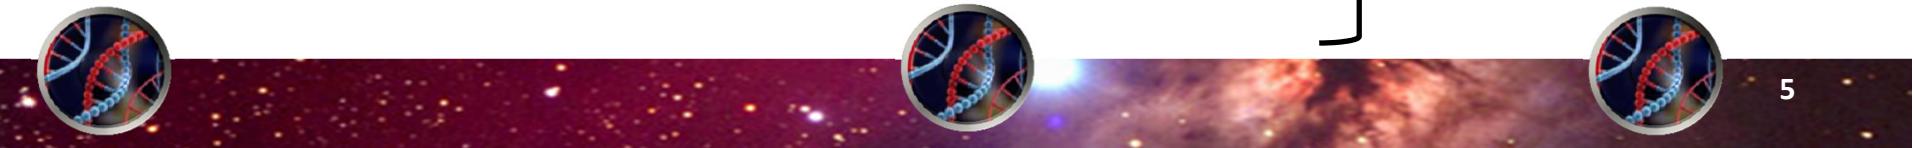

Danger et al. 2011
Motoki et al. 2013

Amino acetonitrile

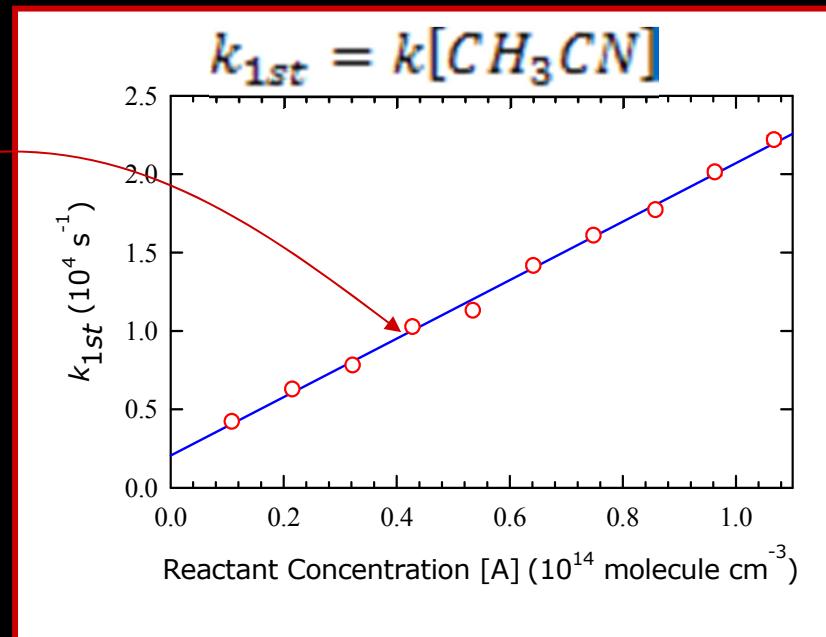

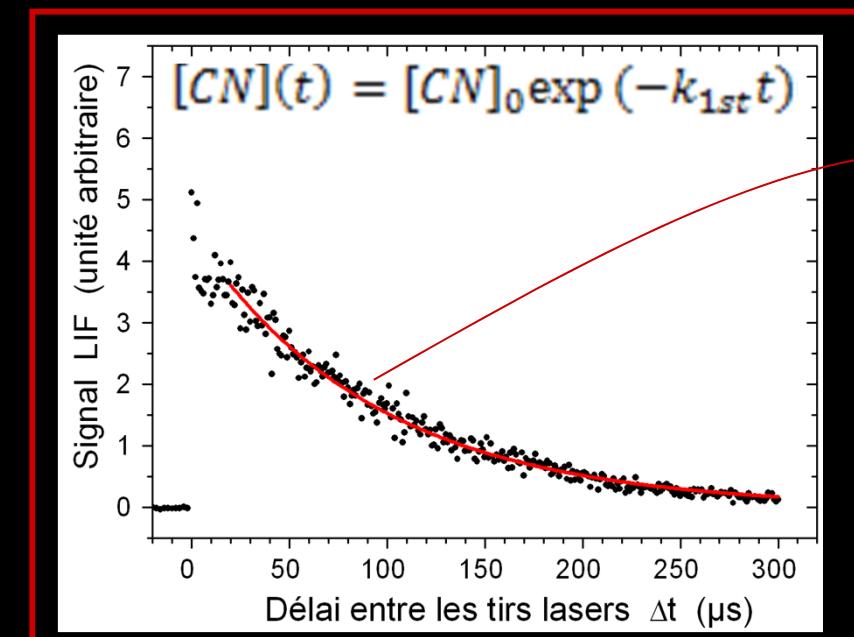

Amino acids \Rightarrow Origin of life

Measuring Rate constants of the studied reaction

CN + CH_3CN → Products

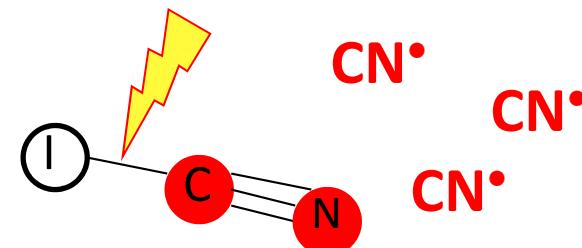

$$\frac{d[\text{CN}]}{dt} = -k[\text{CH}_3\text{CN}][\text{CN}]$$

Experimental Techniques: PLP-LIF

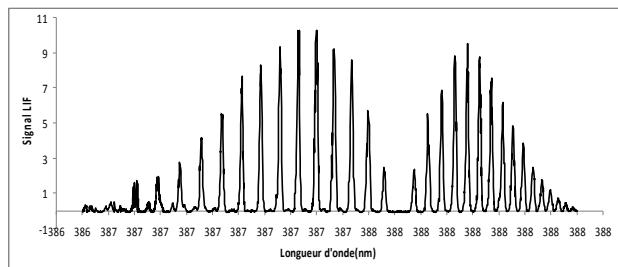

PLP (Pulsed Laser Photolysis)

Generation of CN ($X^2\Sigma^+$) at 266 nm from ICN

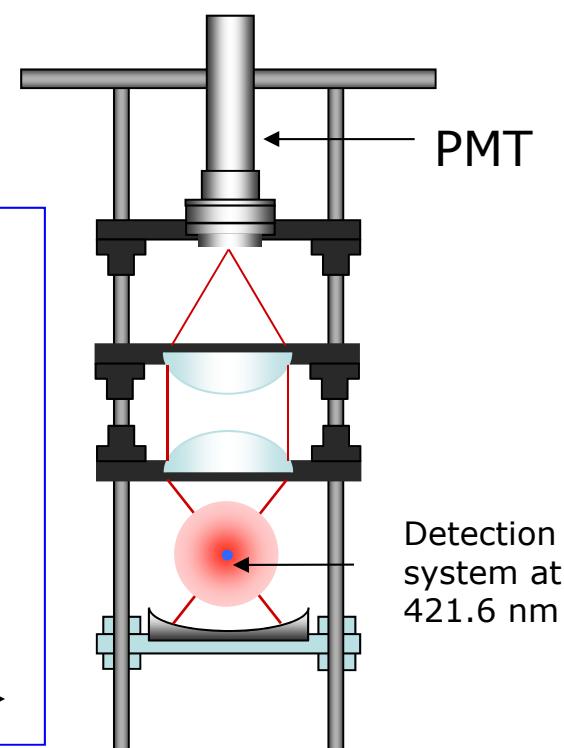

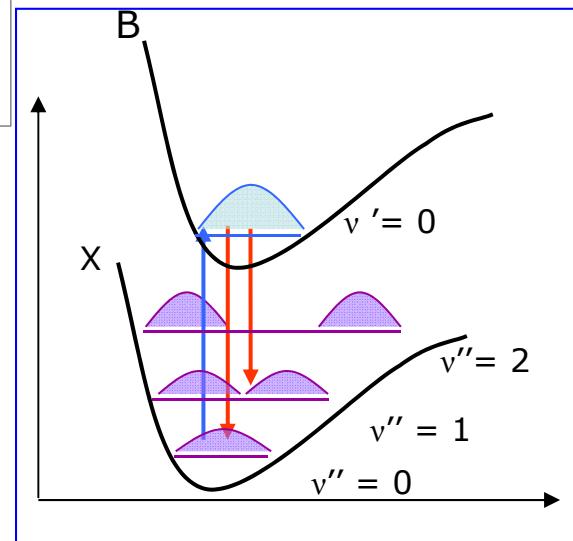

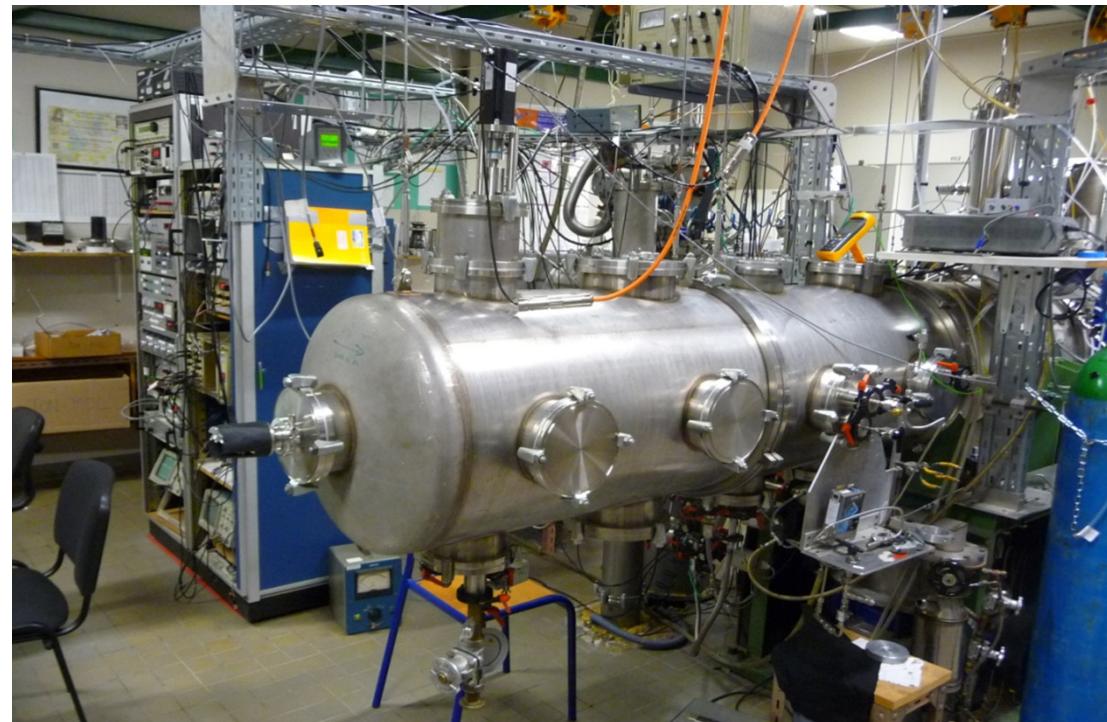

LIF (Laser Induced Fluorescence)

Dye laser (Exalite in dioxane) pumped by a YAG laser at 355 nm— Excitation of CN around 387 nm and fluorescence detection at 421.6 nm

Spectre de CN à 123 K

CRESU

T= 23 K - 168 K

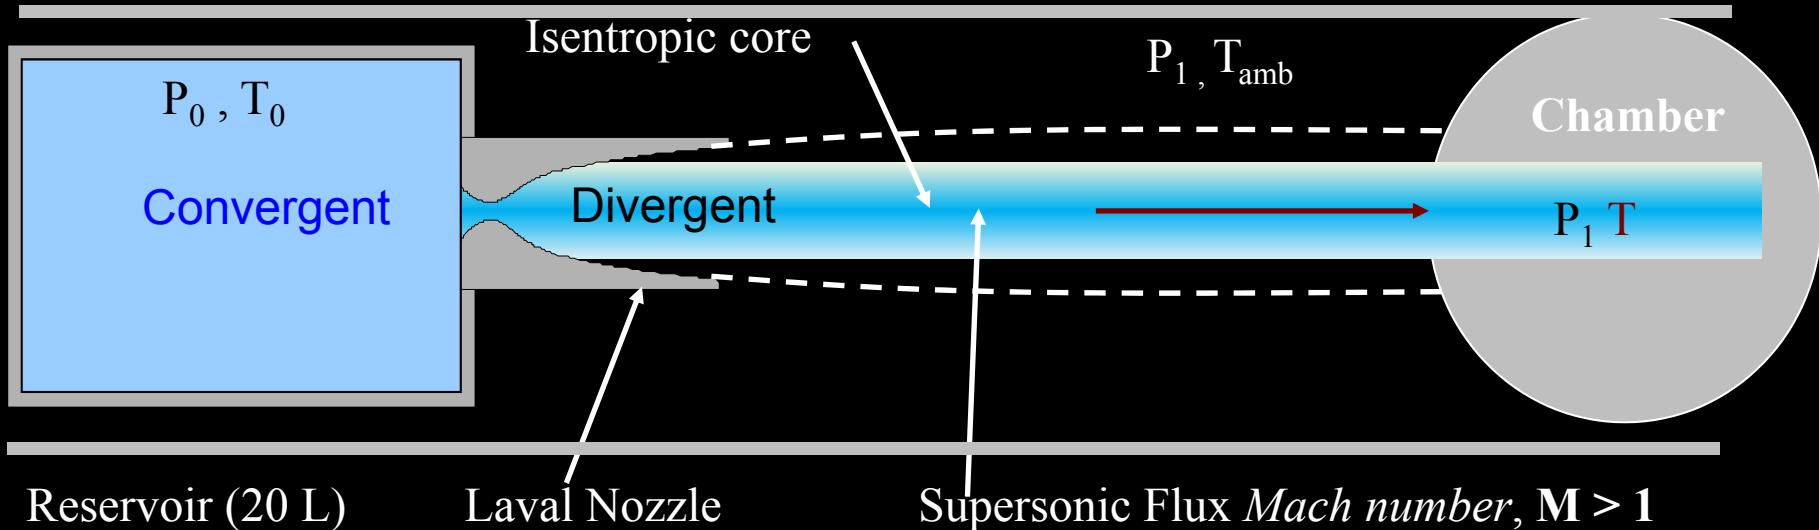

and 297 K subsonic
configuration

Cryogenic cell

T= 258 K - 354 K

CRESU: Cinétique de Réaction en Ecoulement Supersonique Uniforme

P_0 , pressure inside reservoir

T_0 , temperature inside reservoir

P_1 , pressure inside flow, (i.e. inside chamber)

T_1 , temperature inside flow

$$\frac{T}{T_0} = 1 + \frac{\gamma + 1}{2} M^2$$

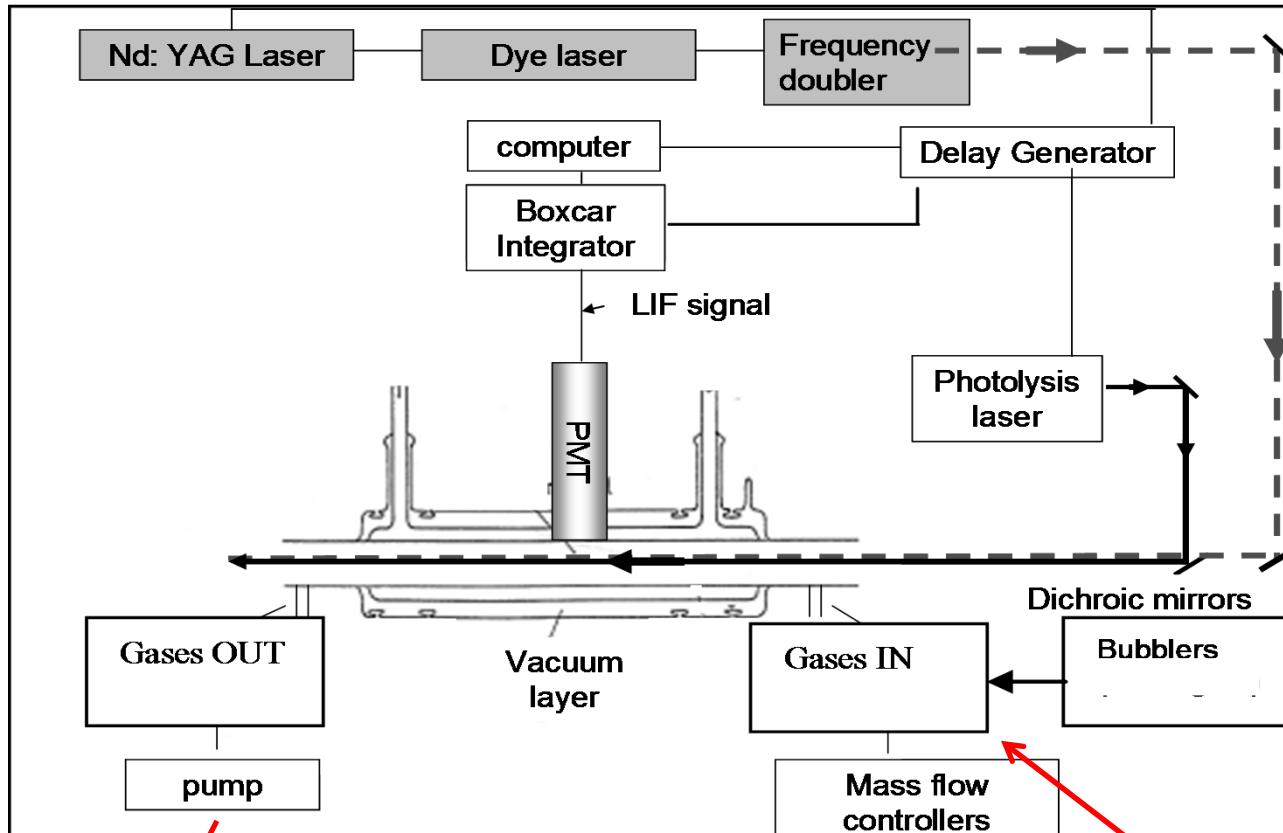

- Due to the supersonic speed, the flow is decoupled from the walls of the chamber. Diffusion is completely negligible \Rightarrow No Condensation

Ideal Chemical Reactor for Low Temperature Studies

Limitations:

$K > 2 \times 10^{-13} \text{ cm}^3 \text{molécule}^{-1} \text{ s}^{-1}$

Experimental Techniques: Cryogenic Cell

Room Temperature or $\neq T$

Using a cryogenic liquid

$258 \text{ K} < T < 354 \text{ K}$ regulated by using a Cryostat

Gas exit
↓
Vacuum

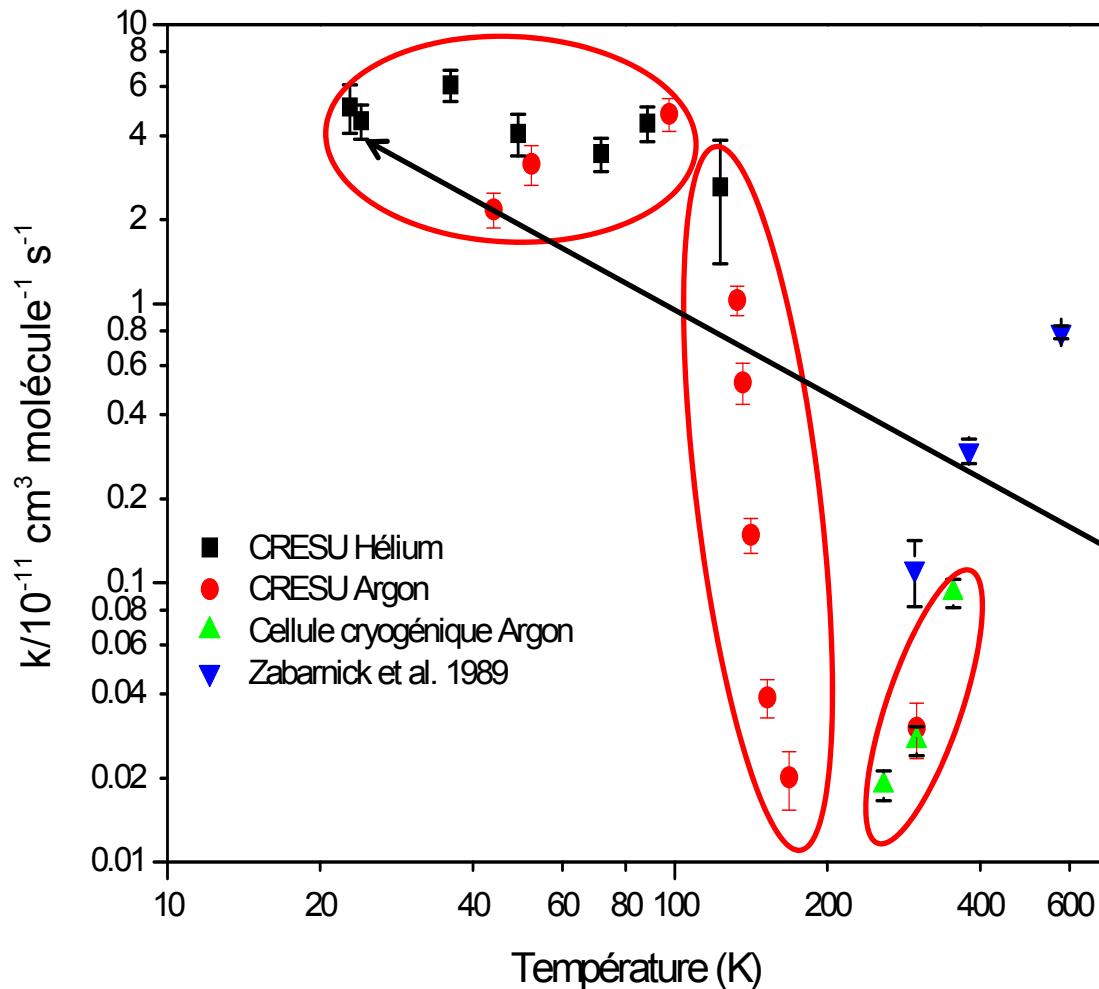

Slow Flow

Pressure: 10 – 760 Torr

Gas Entrance:
buffer gas(He, Ar), reactant
and ICN

Results: CN+ Acetonitrile

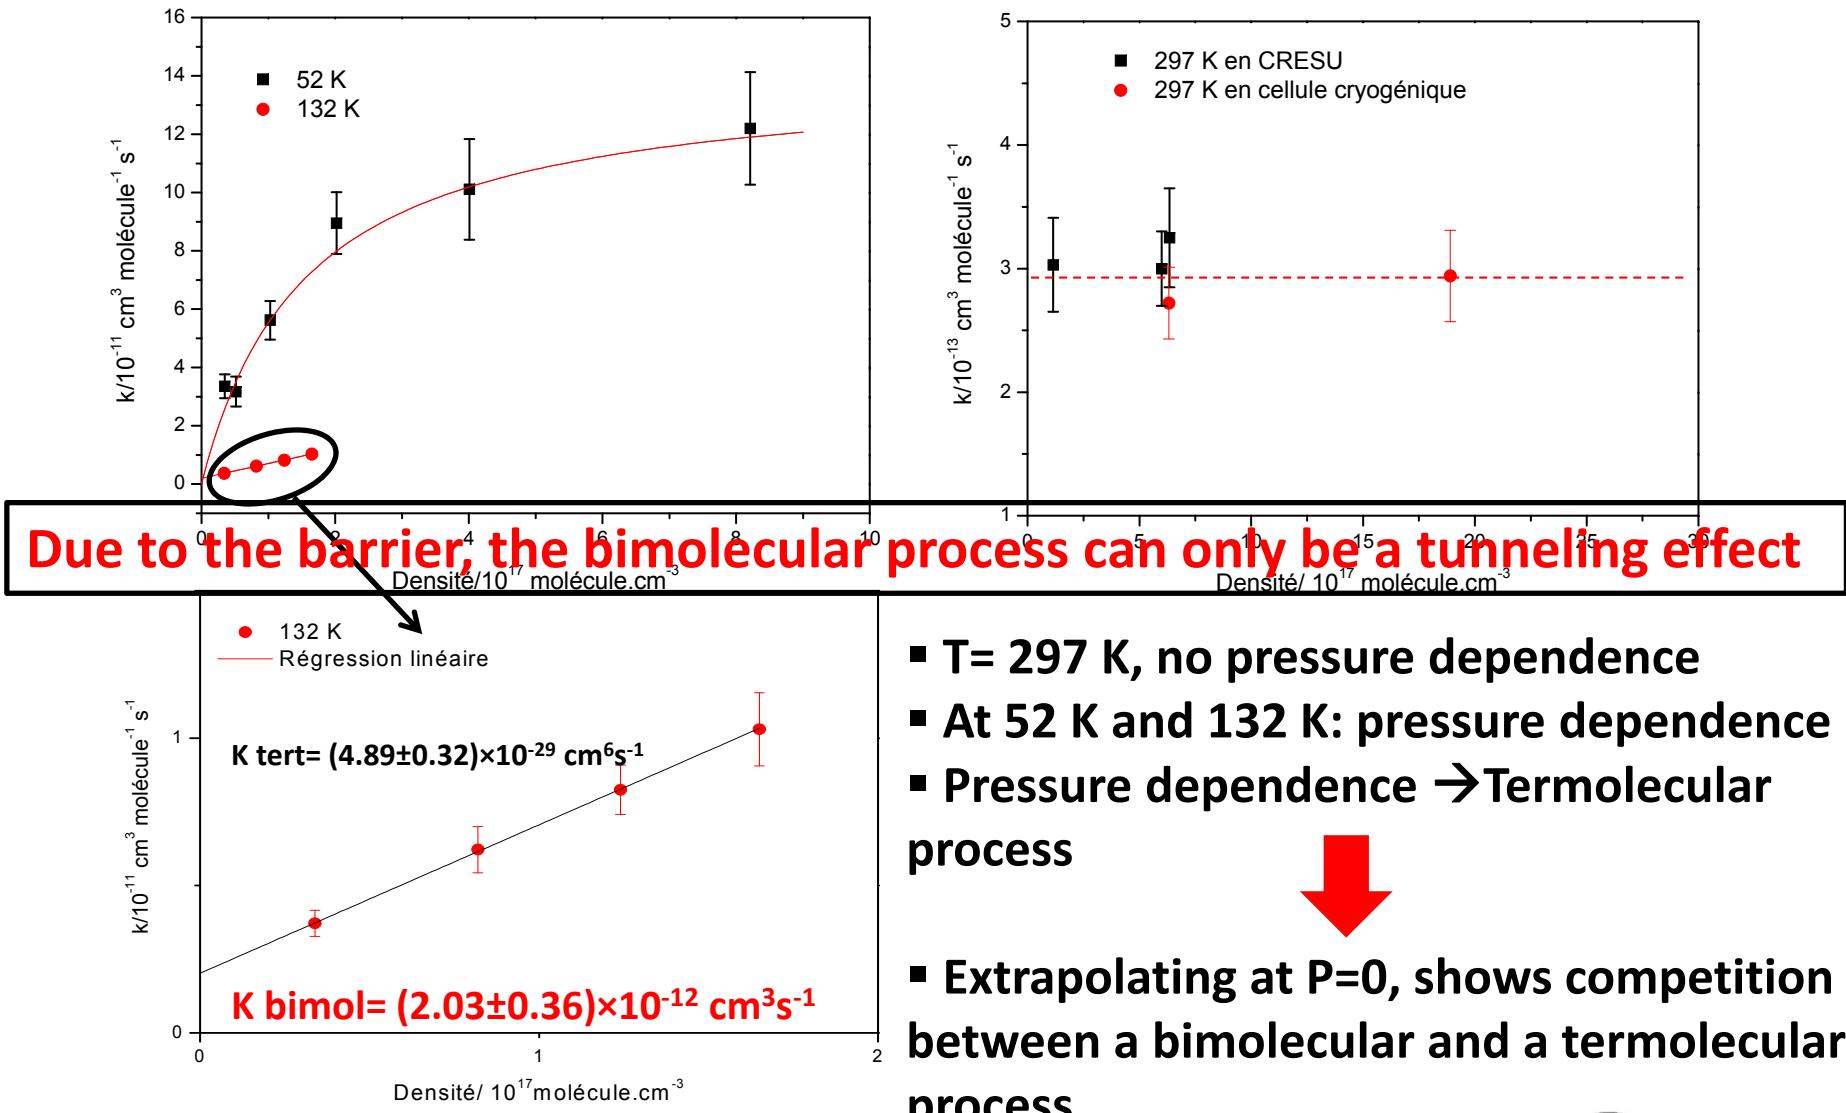

Sleiman C., El Dib G., Gonzalez Rubio S. & Canosa A. (2014, in prep)

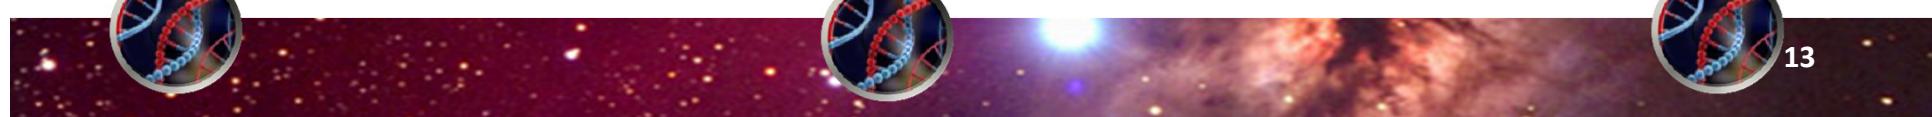

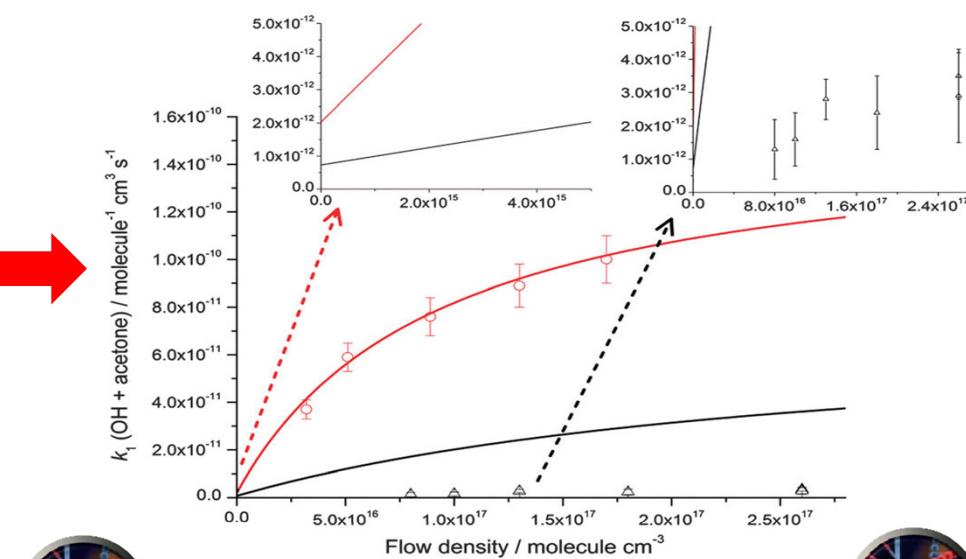

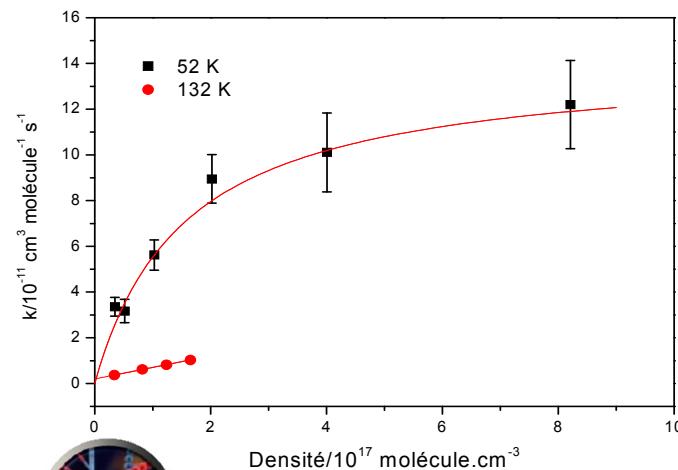

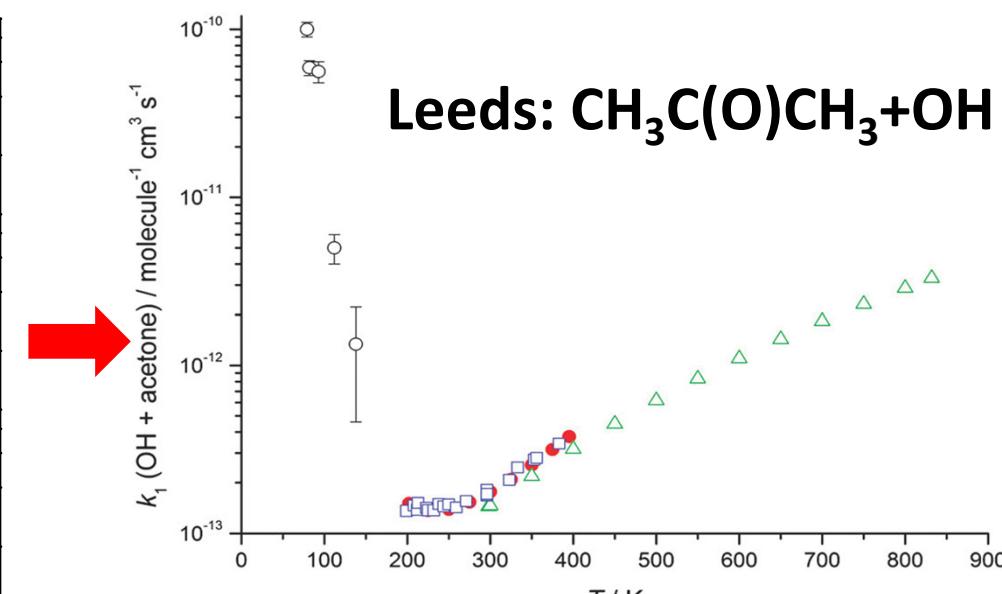

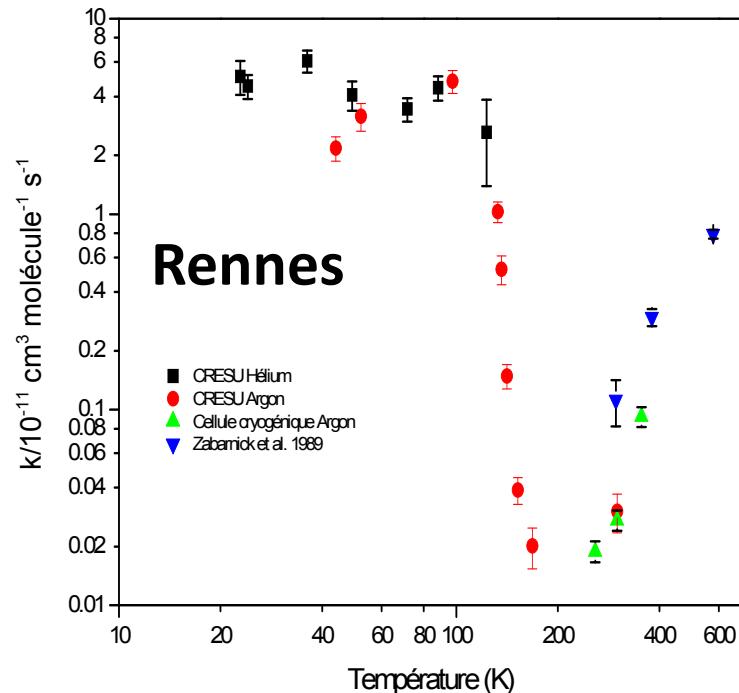

- $T > 200$ K, usual Arrhenius behavior
- Presence of an activation barrier
- $123 < T < 170$ K, Dramatic increase by *two orders of magnitude*
- $T < 123$ K, rate coefficient still increases but at a lower level, reaching a value of $(5.08 \pm 0.86) \times 10^{-11} \text{ cm}^3 \text{ molec.}^{-1} \text{ s}^{-1}$ at 23 K
- Change in the mechanism at low temperature

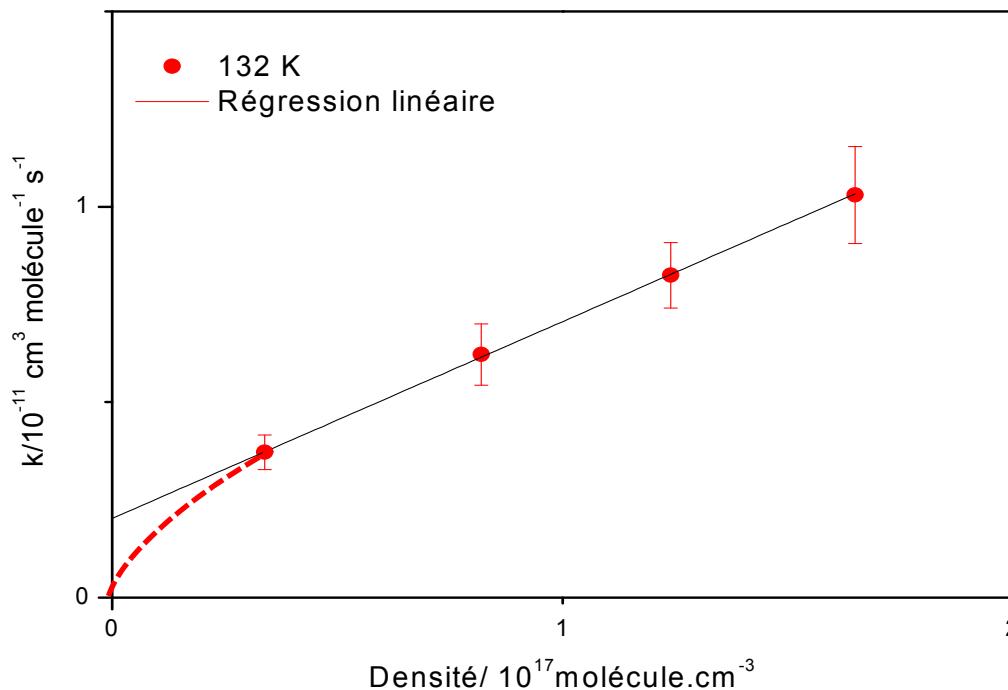

Results: CN + Acetonitrile, Pressure dependence

Results: Similar behavior

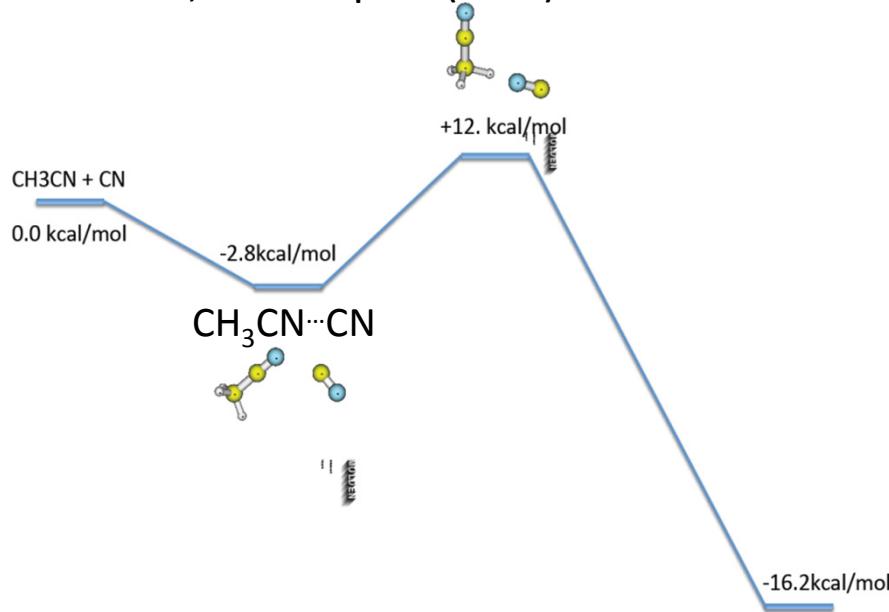

However, fall-off curves may become very broad in the low limit pressure (J. Troe and G. Ushakov)!!!

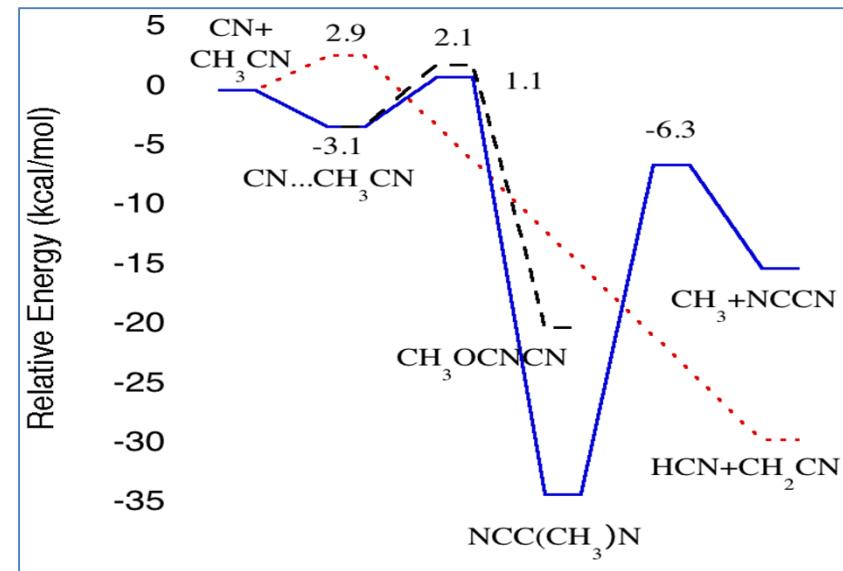

Need to perform more experiments at very low pressures

Results: CN + Acetonitrile, Possible mechanism

From D. Talbi, Univ. Montpellier (France)

From S. Klippenstein, Argonne University (USA)

- Proceeds through an activation barrier via weakly bonded complex ($\text{CH}_3\text{CN}\cdots\text{CN}$ or $\text{CN}\cdots\text{CH}_3\text{CN}$)
- At $T > 200$ K, the complex is short-lived. Dissociation to the reactants
- A large energy barrier is observed and is compatible with the Arrhenius behaviour for $250 < T < 350$ K
- At $T < 200$ K, complex stabilized by the buffer gas : $k_{\text{diss}} \ll k_{\text{formation}}$
- Competition between a bimolecular and a termolecular process.

Conclusions and Perspectives

- At T>200 K, Arrhenius behavior
- At T< 200 K, dramatic increase of rate constants → Change of the reaction mechanism
- ~~Ternolecular process competing with bimolecular process by tunneling effect~~
This study show that reactions which are slow at room temperature can occur a change in their mechanism and can present some interstellar implications!!!!!!
- Interesting to perform more experiments as a function of pressure at different temperatures in order to determine the contribution of tunneling effect as a function of temperature

Thank you
for your
Attention !!!
